Homework

Story:

You've just been hired as a **UI/UX designer** for the Apple India website. While the navigation bar and hero section are complete, the marketing team wants you to add some extra flair to impress users and make navigation smoother. Your goal is to make the top navigation and hero section more interactive and visually stunning.

Your Task:

Add a New Feature

The marketing team wants to showcase more accessories. Add a **dropdown menu** under the Accessories link in the top navigation. When visitors hover over "Accessories," they should see a list that includes "AirPods," "MagSafe," and "Chargers."

Animate the Hero Section

Apple is known for smooth animations. Add a **fade-in effect** to the hero text. The title and description should slowly appear on the screen as users load the page, creating a more dynamic entry.

Enhance the Buttons

The "Learn More" and "Buy" buttons in the hero section are looking great, but they need more interactivity. Add a **hover effect** with a soft shadow and color change to make them pop when a user hovers over them.
